 - [Worksheet Tips](#)

Challenges give students practice on a specific skill, like creating a variable or choosing a color scheme. Typically, there are two challenge steps per lesson, although more difficult or dense lessons may have more.

Instructions in challenges are clear, explicit, contained, and offer visual examples of what the end result should look like, while offering some leeway for students to experiment on their own, too. All challenges should have a "what to do" section with clear, concise, step-by-step directions.

Challenge Step File Formats

- Uploadable file types for challenge steps include pdf, jpg, png, jpeg, and gif.
- Share a link (website, cheatsheet, code, etc.)
- In platform code editor.

Formatting Challenge Steps

Framing

- At the top of the page, frame what the students will complete by the end of the challenge.
- Optionally, introduce any new information with an example.
- When applicable, provide [gifs](#) or images if the student would benefit by seeing the final product from the challenge, or there is a confusing aspect to the challenge. Don't forget to add alt text!

What To Do

- After the framing, guide students through the steps to complete the challenge. Each step should be one small action, like creating a variable or choosing one color for a color scheme.
- If students need to complete a worksheet or fork code, let them know at the beginning of the challenge steps.
- To link worksheets*, write something like: "Save a copy of the Name of Worksheet to your class folder on Google Drive." Capitalize "Worksheet" when it's in the name of the worksheet.
- To link to starter code, write something like: "Fork and rename the starter code."
- If the challenge is difficult or has many steps, break down the steps by adding a bold subheading to chunks of the steps, like "Test & Save Your Project."
- End the steps by asking the student to submit a link, upload a file, or save their code (for in platform editors).
- If the challenge was really difficult or the students completed a big project, let them know at the end how great they did! 😊

Worksheets

Before creating a worksheet, log in as curriculum@skillcrush.com, that way, you don't get emailed to your work email every time someone edits the worksheet, and if you leave your role, the worksheet permissions don't get

messed up. Then, create a worksheet by making a copy of a [worksheet template](#) or a pre-existing worksheet from a previous class. Place the worksheet in the class-specific folder in the [Cheatsheets & Worksheets folder](#).

Next, verify the permissions are set for "anyone with the link can view." When linking worksheets in the challenge step, make sure to change the link to say "/copy" instead of "/edit" at the end of the URL. This way, students will get a copy of the original worksheet, not the original.

Worksheet Tips

- Worksheets should have clear directions and framing at the very top of the worksheet. It's okay if the worksheet directions repeat some information in the challenge step. The focus of worksheet directions should be on what students need to do to complete the worksheet, like guidance on how they should answer questions or what they should think about as they work.
- Use a worksheet template to ensure proper worksheet formatting. Be sure to update all parts of the worksheet are updated, including the title at the top, the footer text, and anything else.
- In a worksheet, never link to the platform or to another worksheet. If referring to another step, tell students to refer back to the challenge step for guidance.
- When offering a hint in a worksheet, we use this formatting: ***Hint!*** - Explain the hint here. (Hint text color: RGB: 241, 96, 89)
- When using numbers in a worksheet, always use the numbered list tool in Google Docs.
